

TRUST Review · Worked Example

One defensible review of the shift-handover Canvas · not a model answer. · Northstar Components AS is fictional.

Team: Worked example

Proposal: Shift-handover drafting assistant

Pre-mortem: *It is six months later and this initiative has caused an operational, legal, ethical, security, or reputational failure. What happened?*
Our headline: an incoming supervisor acted on a draft that looked complete but omitted an open maintenance action.

AREA	MOST IMPORTANT CONCERN	CONCRETE SAFEGUARD
T TASK + CONSEQUENCE What happens if it is wrong, unavailable, manipulated, or incomplete?	<i>A missing open action or a wrong equipment status looks identical to a complete brief, and the incoming supervisor may act on it. If the draft is late at shift change, time pressure invites skipping the checks.</i>	<i>Supervisor verifies every alarm, ticket, and open action against the source system before release. If the draft is late or unavailable, revert to the manual handover template — the fallback stays documented and practised.</i>
R RIGHTS + RULES Could it affect safety, privacy, employment, equal treatment, IP, or contracts?	<i>Shift logs sometimes name employees (absences, mistakes). A drafted brief could drift into performance judgment, touching GDPR duties and works-council expectations.</i>	<i>Personal notes, HR data, and performance comments are excluded at the source. The brief refers to roles, not names, except for action owners. The works council is informed before the pilot starts.</i>
U USERS + OVERSIGHT Who checks, approves, overrides, and handles complaints?	<i>After a week of good drafts, the supervisor may start approving without opening the sources (automation bias) — most likely on the evening-to-night handover, under the most time pressure.</i>	<i>The approval checklist requires ticking each source actually checked. The Production Manager samples two briefs per week against records, and the incoming supervisor can reject any handover.</i>
S SOURCES, SECURITY, SUSTAINABILITY Are sources permitted, current, representative, protected, proportionate?	<i>Free-text log entries could carry pasted content that steers the draft (prompt injection), and access could quietly widen beyond Assembly Line 2's approved systems.</i>	<i>Retrieval is read-only and restricted to the four approved Line 2 sources; document IDs and timestamps are mandatory; no external sources. Access rights are re-reviewed in week two.</i>
T TESTING + TRANSPARENCY What is tested and logged? Who must know AI was involved?	<i>The pilot could “pass” on time saved while completeness quietly degrades — if nobody records which drafts were corrected and why.</i>	<i>Every draft and correction is logged. Completeness is measured against the ten-handover baseline. Each brief is labelled “AI-assisted draft — verified by [name]” and reviewed weekly with both supervisors.</i>

THREE MOST CREDIBLE FAILURE SCENARIOS · one safeguard each

1. Scenario: <u>Incoming supervisor restarts equipment from a draft that missed an open maintenance action.</u>	Safeguard: <u>Availability statements require maintenance confirmation plus the signed source-check.</u>
2. Scenario: <u>Shift-log quality decays because “the AI tidies it up” — the drafts quietly get worse.</u>	Safeguard: <u>Monthly input-quality spot check, with feedback to the shift team rather than blame.</u>
3. Scenario: <u>A personal comment from a shift log appears in a widely shared handover brief.</u>	Safeguard: <u>Tested exclusion filter before go-live; any leak triggers the immediate stop signal.</u>

DECISION	☐ GO — sufficiently bounded for a limited experiment.	☒ CONDITIONAL GO — proceed only after the condition below is met.	☐ NO-GO / REDESIGN — current task, data, AI role, or consequence is unsuitable.
Largest expected benefit:	<u>About 15 minutes saved per handover, with omissions falling from 3/10 toward fewer than 1/10.</u>		Largest credible harm:
Non-negotiable safeguard / condition:	<u>No release without the supervisor's source-check; availability claims need maintenance confirmation.</u>		<u>Action taken on an incorrect equipment status — safety exposure and rework.</u>
Evidence required before scaling:	<u>Four-week pilot: time and completeness vs baseline, the correction log, zero personal-data incidents.</u>		Human owner:
			<u>Production Manager (pilot owner); the outgoing shift supervisor approves each brief.</u>
